

# M5

## Machine-Mounted Methane Monitor

- **No Zero Drift**
- **Lower total cost of ownership**
- **Extremely robust and moisture resistant**
- **Easy to calibrate**

The Matrix M5 is a significant improvement over existing machine-mounted methane monitors available in the US coal market.

Originally developed for South African coal mines, the M5 is designed for lower total cost of ownership for operators, which includes potential reductions in MSHA citations for monitor calibration issues. Outside the US, more than 300 units are currently in operation.

M5 is currently in the MSHA approval process.
